

ABSTRACT OF THE DISCLOSURE

An exercising device includes an exercising assembly such as a bicycle exerciser which is electronically connected to a video game device, and a control device is connected to the exercising assembly so as to receive information of heart rate of users. A plurality of response devices are connected to the exercising assembly and controlled by the controlling device. The response devices are activated according to the information of heart rate of users and information from the video game device. The response devices may provide air flow, oxygen, negative ion, and adjust the resistant force of the exercising assembly.
